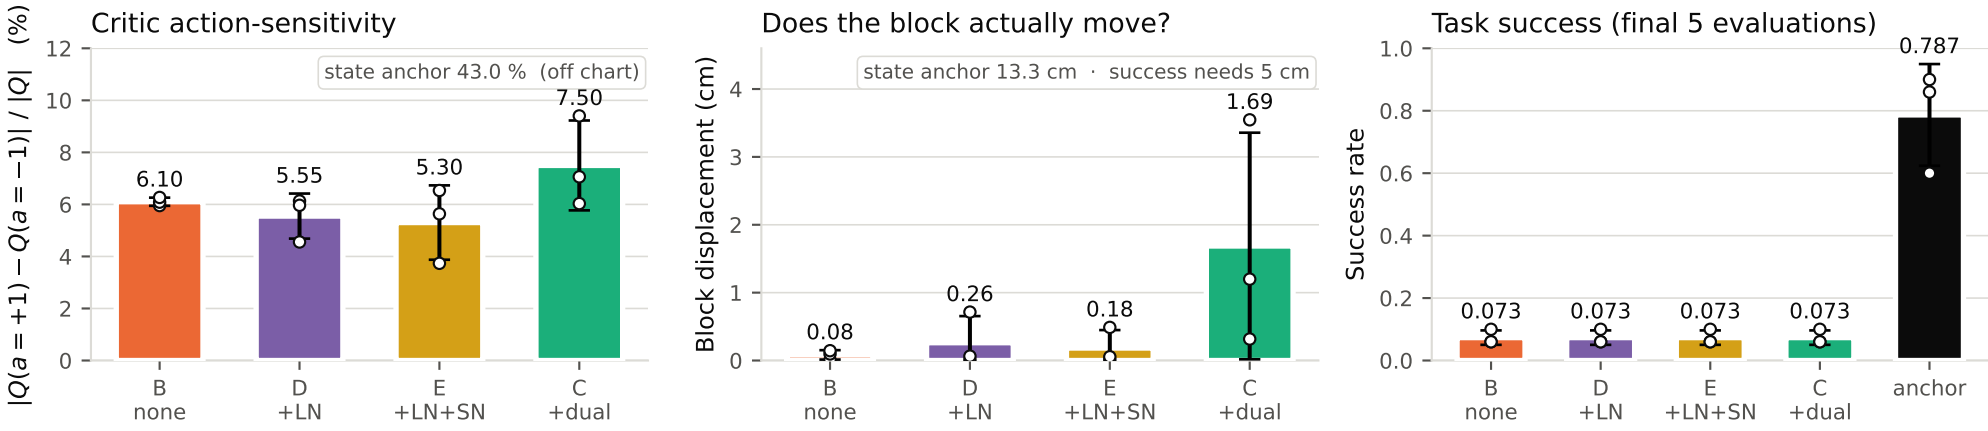
Figure 4 The ablation ladder: adding the paper's components changes nothing



All four rungs run on the occluded task, so each step adds exactly one component: B→D adds LayerNorm, D→E adds SimplexNorm, E→C adds dualization.
White dots are individual seeds; bars are mean ± 1 sd, n=3. Sensitivity does not climb — the two normalization steps move it 6.10 → 5.55 → 5.30, both decreases inside the seed spread. Only dualization separates, and only on displacement: 1.69 ± 1.67 cm vs 0.08 ± 0.07, with no seed overlap (min 0.32 > max 0.14) and no gain in success.
