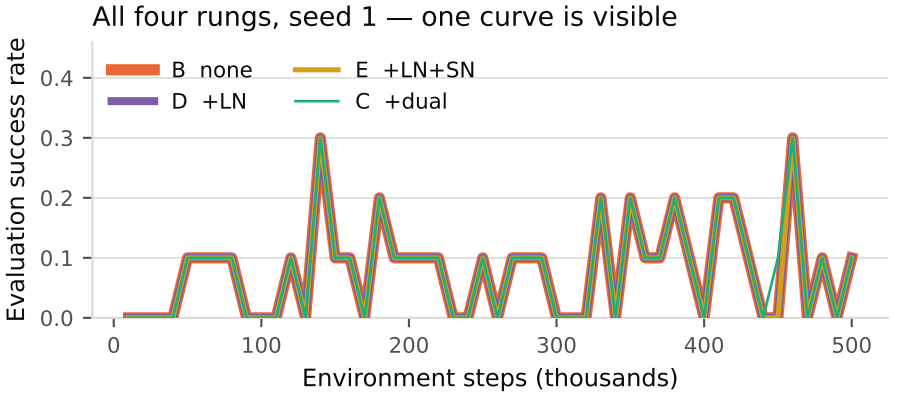
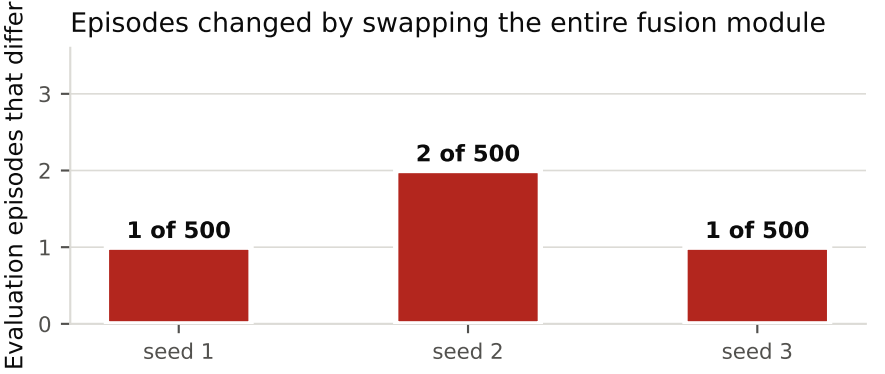
**Figure 6  Task success cannot rank these configurations**





Left: the four rungs are drawn thick-to-thin and still coincide — the trajectories are bit-identical, not merely close. Right: across 500 evaluation episodes per configuration, replacing the fusion module changes the outcome of one or two. No rung moves the block past ~1.7 cm and success needs 5 cm, so the metric reports the block's spawn position and nothing about the policy. The ladder must be read on Figure 4's mechanism columns instead.
